*Approved by the Academic Council of Kharkiv National Medical University as a textbook
(minutes No. 2, 22 February 2018)*

Authors:

I.V. Sorokina, V.D. Markovskyi, D.I. Halata, A.F. Yakovtsova, M.S. Myroshnychenko,
O.M. Pliten, S.M. Potapov, T.V. Bocharova, O.V. Kaluzhyna

Reviewers:

V.O. Tumanskyi — Doctor of Medical Sciences, Professor of the Department of Pathologic Anatomy and Forensic Medicine with Bases of Law of Zaporizhzhia State Medical University;

O.S. Protsenko — Doctor of Medical Sciences, Professor, Head of the Department of General and Clinical Pathology of V.N. Karazin Kharkiv National University

P31 **Pathomorphology** : textbook / I.V. Sorokina, V.D. Markovskyi, D.I. Halata et al. ; edited by I.V. Sorokina, V.D. Markovskyi, D.I. Halata. — Kyiv : AUS Medicine Publishing, 2019. — 328 p. + 2 colour inserts (8 p. + 12 p.).
ISBN 978-617-505-738-4

The textbook is written by a group of authors of the pathological anatomy department of Kharkiv National Medical University. The modern actual information on general and special pathomorphology is presented in English. The textbook consists of two parts. The first part is devoted to general pathological processes: damage of cells and tissues, regeneration and adaptation, circulation disorders, inflammation, immune pathology, basics of oncology and tanatology. The second part covers the pathomorphology of diseases according to the nosological principle. The morphological manifestations of pathological processes are described using the newest research methods at the organ, tissue, cellular and subcellular levels, with high-quality illustrations (see colour inserts) of macro- and microspecimens. The edition is supplemented with the chapter Oral Pathology, which allows it to be of use for students of the dentistry faculty.

For English-speaking students of higher medical education establishments of Ukraine in the specialties "general medicine", "dentistry".

Contents

Part 1 GENERAL PATHOMORPHOLOGY

Chapter 1. CELL AND TISSUE INJURY.....	6
1. Intracellular Dystrophies.....	10
2. Stromal-Vascular Dystrophies.....	16
3. Pathology of Pigments (Mixed Dystrophies)	23
4. Mineral Metabolism Disturbances	27
5. Necrosis. Apoptosis.....	30
Chapter 2. BLOOD AND LYMPH CIRCULATION DISTURBANCES	35
1. Blood Filling Disturbances	35
2. Vascular Permeability Disturbances.....	37
3. Blood Rheology Disturbances.....	38
4. Dic Syndrome.....	41
5. Shock.....	43
6. Lymph Circulation Disturbances.....	44
7. Interstitial Fluid Amount Disturbances.....	44
Chapter 3. INFLAMMATION.....	46
1. Exudative Inflammation.....	50
2. Proliferative Inflammation.....	52
Chapter 4. IMMUNOPATHOLOGICAL PROCESSES	56
1. Cells And Organs of the Immune System.....	56
2. Immune Response	60
3. Pathomorphology of Immunopathological Processes	61
4. Changes of the Antigen-Stimulated Lymphoid Tissue.....	62
5. Hypersensitivity Reaction	62
6. Autoimmune Diseases.....	64
7. Immune Deficiency Syndromes.....	66
Chapter 5. TISSUE REPAIR AND ADAPTATION	69
1. Regeneration	69
2. Wound Healing.....	71
3. Healing in Specialised Tissues	73
4. Adaptation	75
5. Compensation.....	79
Chapter 6. NEOPLASIA	81
1. General Characteristics of Neoplasia.....	81
2. Mesenchymal Tumours.....	84
3. Tumours of the Nervous System and Brain Membranes	89
4. Tumours of the Melanin-Forming Tissue.....	95
5. Epithelial Tumours	97
6. Cancers of Specific Organs	101

Contents**Part 2
SYSTEMIC PATHOMORPHOLOGY**

Chapter 7. HAEMOPOIETIC AND LYMPHOID SYSTEM PATHOLOGIES.....	108
1. Red Cell Pathology	108
2. White Cell Pathology	115
3. Thrombocyte Pathology	123
Chapter 8. CARDIOVASCULAR PATHOLOGIES	124
1. Atherosclerosis	124
2. Ischaemic Heart Disease.....	127
3. Hypertensive Vascular Disease.....	129
4. Systemic Diseases of the Connective Tissue with Immune Disturbances (Rheumatic Diseases)	133
Chapter 9. CENTRAL NERVOUS SYSTEM PATHOLOGIES.....	141
1. Cerebrovascular Pathology	141
2. Head Injury	143
3. Hydrocephalus	145
4. Demyelinating Diseases	145
5. Neurodegenerative Diseases	146
6. Spongiform Encephalopathies	147
7. Tumours	147
Chapter 10. RESPIRATORY SYSTEM PATHOLOGIES	148
1. Acute Respiratory Pathology.....	148
2. Chronic Obstructive Pulmonary Diseases	153
Chapter 11. GASTROINTESTINAL TRACT PATHOLOGIES.....	160
1. Throat and Pharynx.....	160
2. Oesophagus	161
3. Stomach.....	163
4. Intestines.....	168
5. Appendix.....	172
6. Peritoneum	174
Chapter 12. LIVER, GALLBLADDER AND PANCREAS PATHOLOGIES.....	175
1. Liver	175
2. Gallbladder	197
3. Pancreas	199
Chapter 13. RENAL AND URINARY TRACT PATHOLOGIES.....	201
1. Glomerulopathies	201
2. Tubulopathies	208
3. Pyelonephritis	210
4. Nephrolithiasis	212
5. Polycystic Renal Disease	213
6. Nephrosclerosis.....	214
7. Tumours of the Kidneys	216
Chapter 14. ENDOCRINE SYSTEM PATHOLOGIES.....	218
1. Pituitary Body.....	218
2. Adrenal Glands	219
3. Thyroid Gland	221
4. Parathyroid Glands	223
5. Diabetes Mellitus.....	224

Contents

Chapter 15. REPRODUCTIVE SYSTEM PATHOLOGIES	226
1. Male Reproductive System	226
2. Female Reproductive System	228
3. Breast	234
4. Obstetric Pathology	235
Chapter 16. PRENATAL AND PERINATAL PATHOLOGIES	239
1. Prenatal Pathology.....	239
2. Perinatal Pathology.....	245
Chapter 17. INFECTIOUS PATHOLOGIES.....	250
1. General Pathology of Infectious Diseases.....	250
2. Gastrointestinal Tract Infections.....	251
3. Viral Diseases.....	255
4. Rickettsioses.....	266
5. Tetanus	268
6. Childhood Infectious Diseases.....	269
7. Tuberculosis	277
8. Sepsis	284
9. Syphilis	288
10. Quarantine Infections	291
11. Prion Diseases.....	296
12. Protozoal And Helmintic Diseases	298
Chapter 18. ORAL PATHOLOGIES	303
1. Pathology of the Hard Tooth Tissue.....	303
2. Pathologies of the Tooth Pulp and Periodontium.....	308
3. Pathology of the Gums and Periodontium	311
4. Pathology of the Jaw Bones	314
5. Pathology of the Salivary Glands.....	322
6. Pathology of the Lips, Tongue and Soft Tissues of the Oral Cavity	325
References	327

Chapter 1

CELL AND TISSUE INJURY

INJURY (alteration) is a change in the cell structure, intercellular substance, tissues and organs accompanied by disturbances in their vital activity.

There are different morphological manifestations of an injury in the cells and tissues. Subcellular alteration, which largely occurs as a response to more or less constant stimuli and intracellular accumulation of a number of substances, due to the disturbances in cellular metabolism or excessive storage, as well as cell death (necrosis and apoptosis) have been described in the cells. Visible changes occur in the cells as a result of noxious agents, the degree of changes varying with the severity of the damaging processes: with minor damage the repair mechanisms change, more severe damage results in cell death. There are a lot of genetic and acquired causes of cell injury.

Genetic causes of cell injury producing disease may result from one of the following abnormalities:

1. Abnormalities of chromosomes.
2. Abnormalities of genes carried by chromosomes.
3. Disorders with multifactorial inheritance.
4. Disorders with variable genetic pattern.

Abnormalities of Chromosomes

There are abnormalities in the number and/or morphology of chromosomes.

During meiosis in gametogenesis, two homologous chromosomes rather than moving to the opposite poles of the dividing cell, instead move to the same side so that one germ cell receives both chromosomes and the other germ cell receives none. This is referred to as **chromosomal nondisjunction**. The main examples of chromosomal nondisjunction are: Turner's syndrome (monosomy 45, XO), Klinefelter's syndrome (trisomy 47, XXY), Down's syndrome (trisomy 21 involving autosome 21).

When one homologous chromosome in meiosis or one chromatid in mitosis fails to reach the pole of the dividing cell and is left out of the nucleus of the daughter cell, it is called **anaphase lag**. This results in one normal daughter cell and the other with monosomy.

Great deals of inherited and acquired structural abnormalities of the chromosomes have been described.

Translation means transfer of a segment of one chromosome to another nonhomologous chromosome. It may be of either of the following types: (1) balanced translocation, when the two fragments of chromosomes exchange material without any loss of material; (2) Robertsonian translocation, when two acrocentric chromosomes lose their short arms and fuse at the centromere so that eventually the cell is left with 45 chromosomes.

Deletion means loss of part of the DNA from a chromosome. Deletion may be from terminal or middle portion of the chromosome. When both ends of a chromosome are lost and the two damaged ends join together, they form a ring chromosome.

Abnormalities of Genes Carried by Chromosomes

Mendelian disorders are the result of mutation of a single gene of large effect. The term "mutation" refers to heritable alteration in the genome, more often affecting a single base in the gene so that protein synthesis is interfered with. The common types of mutations are *point mutation* and *frameshift mutation*. Mutations may be inherited from a parent, or may occur as a result of environmental influence such as radiation, chemicals and viruses as occurs in carcinogenesis.

The inheritance pattern of genetic abnormalities may be dominant or recessive, autosomal or sex-linked. A dominant gene produces its effects, whether combined with similar dominant or recessive gene. Recessive genes are effective only if both genes are similar. However, when both alleles of a gene pair are expressed in heterozygote state, it is called codominant inheritance. A single gene may express in multiple allelic forms known as polymorphism. Genes on Y-chromosome are determinant for testis and are not known to cause any sex-linked disorder. Therefore, all sex-linked disorders are, in fact, X-linked disorders. All people carrying abnormal gene pairs for a character are affected differently. Penetrance means mathematical expression of mutant gene-character as present in the individual, while variable expressivity is variable expression of mutant gene in the different individuals.

Disorders with Multifactorial Inheritance

These are disorders which result from the combined effect of genetic composition and environmental influences. Some normal phenotypic characteristics have also multifactorial inheritance, e. g. the colour of hair, eye, skin, height and intelligence. Some examples of disorders where environmental influences unmask the mutant genes are: (1) autosomal recessive inheritance: beta thalassaemia, sickle cell anaemia, albinism, Wilson's disease etc.; (2) autosomal codominant inheritance: HLA antigens, blood group antigens; (3) autosomal dominant inheritance: family polyposis coli, hereditary spherocytosis, neurofibromatosis, Marfan's syndrome etc.; (4) sex (X)-linked recessive inheritance: haemophilia A, diabetes insipidus etc.; 5) sex (X)-linked dominant inheritance: hypophosphataemic rickets, incontinentia pigmenti etc.

The causes of acquired damage of cells are various. Their main groups are the following:

1. Hypoxia, i. e. reduced oxygen supply (respiratory disease, cardiovascular disease, anaemia).
2. Physical agents (mechanical trauma, excessive heat or cold, radiations).
3. Chemical agents (these continue to increase enormously with the complexity of industrial processes).
4. Toxins (bacteria, plants, animals, e. g. tuberculosis).
5. Viruses.
6. Abnormal immunological reaction (hypersensitivity states, glomerulonephritis).
7. Nutritional deficiencies (vitamin deficiency and malabsorption syndromes).

CELLULAR REACTIONS TO DAMAGE

Cellular reactions to damage depend on the type, duration and severity of the injury induced. The response can range from a minimal and reversible disturbance of cell volume to massive irreversible swelling with a concomitant loss of cell function, followed by death. When injury develops rapidly, it is conventionally referred to as "acute injury". The factor that ultimately determines whether a cell will survive or succumb after injury remains to be unequivocally established. Irreversibility is probably attributable to the effect of the loss of several vital functions coupled with increased degradation of intracellular components. Recent studies indicate that in the early stages of cell injury there are significant losses of phospholipids from cell membranes. This leads to functional alterations of the cell, presumably resulting from activation of intracellular phospholipases.

If stress is sufficiently prolonged, the cells will certainly die; perhaps this occurs when the synthesis of a certain vital molecule or molecules is sufficiently compromised that the renewal of cell substance is critically impaired. In less intense and prolonged forms of stress, termed "chronic injury", cells are able to adapt to environmental abnormalities to the extent that they are capable of augmented rather than diminished function.

Cells may adapt to a pathological (disease) stimulus by extending the three normal physiological adaptive responses:

1. Increased cellular activity — increased functional demand on a tissue can be met by an increase in cell number (hyperplasia), as well as by an increase in cell size (hypertrophy).
2. Decreased cellular activity — cell atrophy.
3. Alteration of cell morphology (degeneration, apoptosis, necrosis).

The response of cells to an adverse environment is conditioned by numerous intracellular and extracellular factors. These can be classified into four broad categories: extracellular and intracellular milieu, pattern and degree of metabolic activity, level of cell differentiation and amount and expression of information contained in the genome.

Studies of acute injury caused by a variety of noxious agents on both isolated cells and tissue have shown a striking similarity in the types and sequence of morphologic changes, regardless of the nature of the injurious agent. The initial event, occurring almost immediately after exposure of a cell to a noxious environment, is a loss of cell volume control, which is rapidly followed by a decrease in the optical density of the cytoplasm because of intracellular swelling (hydropic change) and eventual accumulation of lipid droplets (fatty change). If the noxious agent is particularly toxic, additional alterations are seen: violent movements of the plasma membrane followed by the development of bizarre pseudopodia and blebs of the plasma membrane, nuclear swelling, condensation of nucleus chromatin (pyknosis), dissolution of the nucleus (karyolysis) and finally lysis of the cell (cytolysis).

Cell death is that state in which cells are incapable of any function, including energy generation, homeostatic control, motility, uptake of materials, synthesis, export cell communication and excitability and reproduction.
